This pages addresses frequently (and not so frequently) encountered issues.

sbt

I get IncompatibleClassChangeError when I start sbt

This is because you have an older version of sbt installed on your computer, typically 0.12.x. You need to install sbt 0.13.x.

The compiler doesn't recognize ForkJoinPool and other ForkJoin stuff

That's because you use Java 6. You need to use Java 8.

Eclipse

First things first: verify that things work with sbt! If it doesn't work in sbt, first fix the issues in sbt.

Eclipse doesn't know about org.scalameter and stuff

That is because you did not import the project into Eclipse correctly. You need to delete the Eclipse project, *generate an Eclipse project using sbt*, then use Import > General > Existing project into workspace.

I get errors in the Problems tab telling me it cannot find ./lib/something.jar

Open sbt and run update. Then refresh the project in Eclipse.

Mark as completed
